Москва, 2023

Постановка задачи

Вариант 6.

Умножение матриц, содержащих комплексные числа.

Составить программу на языке Си, обрабатывающую данные в многопоточном режиме. При обработки использовать стандартные средства создания потоков операционной системы (Windows/Unix).

Ограничение максимального количества потоков, работающих в один момент времени, должно быть задано ключом запуска вашей программы. Так же необходимо уметь продемонстрировать количество потоков, используемое вашей программой с помощью стандартных средств операционной системы.

Общий метод и алгоритм решения

Использованные системные вызовы:

1. thread(matrix_multiple, ref(matr1), ref(matr2), ref(answer), start, end, m, n, k); – создаёт новый поток;
2. threads[i].join(); – ожидает завершения потока.

Программа условно делит матрицы на части, передает их потокам, где в одном потоке обрабатывается только определенное количество строк первой матрицы, то есть формируем ответ также построчно.

Сами матрицы храним в линеаризованном виде, используя вектор пары. Такой способ хранения данных выбран из-за особенностей данных. Они представлены комплексными числами, то есть содержат действительную и мнимую части. Умножение таких чисел имеет вид:
$(a + bi) * (c + di) = ac + adi + bci - bd.$

Код программы

```
#include<iostream>
#include<chrono>
#include<vector>
#include<thread>
#include<mutex>
using namespace std;
using namespace std::chrono;

mutex mtx;

void matrix_multiple(std::vector<std::pair <double, double> >& a,
std::vector<std::pair <double, double> >& b,
                  std::vector<std::pair <double, double> >& ans, size_t start,
size_t end, int m, int n, int k){
   for (size_t i = start; i < end; i++){
       for (size_t j = 0; j < n; j++){
           double d_ans = 0.0; double m_ans = 0.0;
           for (size_t l = 0; l < k; l++){
               mtx.lock();
               std::pair pair1 = a[m*i+l];
               std::pair pair2 = b[n*l+j];
               d_ans += pair1.first * pair2.first - pair1.second * pair2.second;
               m_ans += pair1.first * pair2.second + pair1.second * pair2.first;
               mtx.unlock();
           }
           ans.push_back(make_pair(d_ans,m_ans));
       }
   }
}

int main(int argc, char* argv[]) {

   if (argc != 2){
       cout << "Incorrect usage. Arguments are not instantiated" << endl;
       cout << "Usage: ./lr2 number_of_treads" << endl;
       exit(1);
   }

   size_t num_threads = atoi(argv[1]);

   //Матрица хранится в векторы пары. В первой ячейке действительная часть, во
второй мнимая
   //Пример a + b*i, arr.first = a, arr.second = b
   //Умножение таких чисел: (a+bi)*(c+di) = ac+adi+bci-bd, тогда результат:
res.first=ac-bd, res.second=ad+bc

   cout << "Enter the dimension of the matrices to be multiplied to fill them
with random numbers" << endl;
   cout << "Matrix format: m*n, n*k, enter 3 natural numbers" << endl;
   int m,n,k; cin >> m >> n >> k; cout << endl;
   if (m < num_threads){
       cout << "No need for treads. Parameter m is less then number of threads"
<< endl;
```

```
        exit(1);
    }
    if (m < 0 || n < 0 || k < 0){
        cout << "Incorrect values of matrix dimensions. Values should be natural"
<< endl;
        exit(1);
    }

    vector <pair <double, double> > matr1;
    for (int i = 0; i < m*n; i++){
        double a,b;
        a = rand() % 100;
        b = rand() % 100;
        matr1.push_back(make_pair(a,b));
    }

    vector <pair <double, double> > matr2;
    for (int i = 0; i < k*n; i++){
        double a,b;
        a = rand() % 100;
        b = rand() % 100;
        matr2.push_back(make_pair(a,b));
    }
    vector <pair <double, double> > answer(n*k);

    vector<thread> threads(num_threads);

    size_t block_size = m / num_threads;
    size_t remainder = m % num_threads;

    auto begining = std::chrono::high_resolution_clock::now();

    size_t start = 0;
    for (int i = 0; i < num_threads; i++) {
        size_t end = start + block_size;
        if (i < remainder) {
            end++;
        }
        threads[i] = thread( matrix_multiple, ref(matr1), ref(matr2),
ref(answer), start, end, m, n, k);
        start = end;
    }

    for (int i = 0; i < num_threads; i++) {
        threads[i].join();
    }

    auto ending = std::chrono::high_resolution_clock::now();

    duration<double> sec = ending - begining;
    cout << "Result: ";
    cout << sec.count() << " s" << std::endl;
    answer.clear(); matr1.clear(); matr2.clear();

    return 0;
}
```

Протокол работы программы

Тестирование:

```
./lr2 1
Enter the dimension of the matrices to be multiplied to fill them with random numbers
Matrix format: m*n, n*k, enter 3 natural numbers
6 6 6
Result: 0.000411662 s
./lr2 2
Enter the dimension of the matrices to be multiplied to fill them with random numbers
Matrix format: m*n, n*k, enter 3 natural numbers
6 6 6
Result: 0.000893935 s
./lr2 3
Enter the dimension of the matrices to be multiplied to fill them with random numbers
Matrix format: m*n, n*k, enter 3 natural numbers
6 6 6
Result: 0.00234427 s
./lr2 4
Enter the dimension of the matrices to be multiplied to fill them with random numbers
Matrix format: m*n, n*k, enter 3 natural numbers
6 6 6
Result: 0.00123548 s
./lr2 5
Enter the dimension of the matrices to be multiplied to fill them with random numbers
Matrix format: m*n, n*k, enter 3 natural numbers
6 6 6
Result: 0.00164288 s
```

Количество потоков	Время, с	Ускорение	Эффективность
1	0.000411662	1	1
2	0.000893935	0,460505518	0,230252759
3	0.00234427	0,175603493	0,058534498
4	0.00123548	0,333200052	0,083300013
5	0.00164288	0,250573383	0,050114677

При анализе таблицы становится понятно, что выделение потоков значительно превышает по времени математические операции. При 4 потоках можем увидеть небольшое повышение эффективности. Можно объяснить это полным задействованием ресурсов машины, то есть 4 потоков на 2 ядрах.

```

Вывод

В ходе данной лабораторной работы я научилась создавать в своей программе потоки и использовать их для экономии времени вычислений. Я разделяла матрицу на части и передавала ее потокам. К сожалению, это, по сути, не могло ускорить решения, так как сложность все равно осталась O(n*m*k), где n,m,k - размерности умножаемых матриц. Но при выделении определенного числа потоков можно было увидеть небольшое повышение эффективности, что свидетельствует о том, что распараллеливание вычислений способствует ускорению работы программы.
